

# Problem Statement

---

## Day 2

The requirement specification for a meeting dashboard application in an organization is as follows:

- Any member of an organization can host a meeting and send an invitation to other members within an organization.
- Invitees can accept or reject the meeting with proper reason.
- Every meeting has the title, timestamp and place/location associated.
- Every meeting has predefined agendas and documents associated.
- Meeting discussion concludes with identifying tasks to accomplish.
- Every task has a title, priority, deadline, and note associated with it.
- A task can be assigned to any attendee of the meeting.

Design MongoDB schema and implement a set of API for the above application. You can use frontend technology of your choice i.e. PHP, Python, NodeJS, and JAVA, etc.

(Necessary assumptions could be made for detailed design.)
